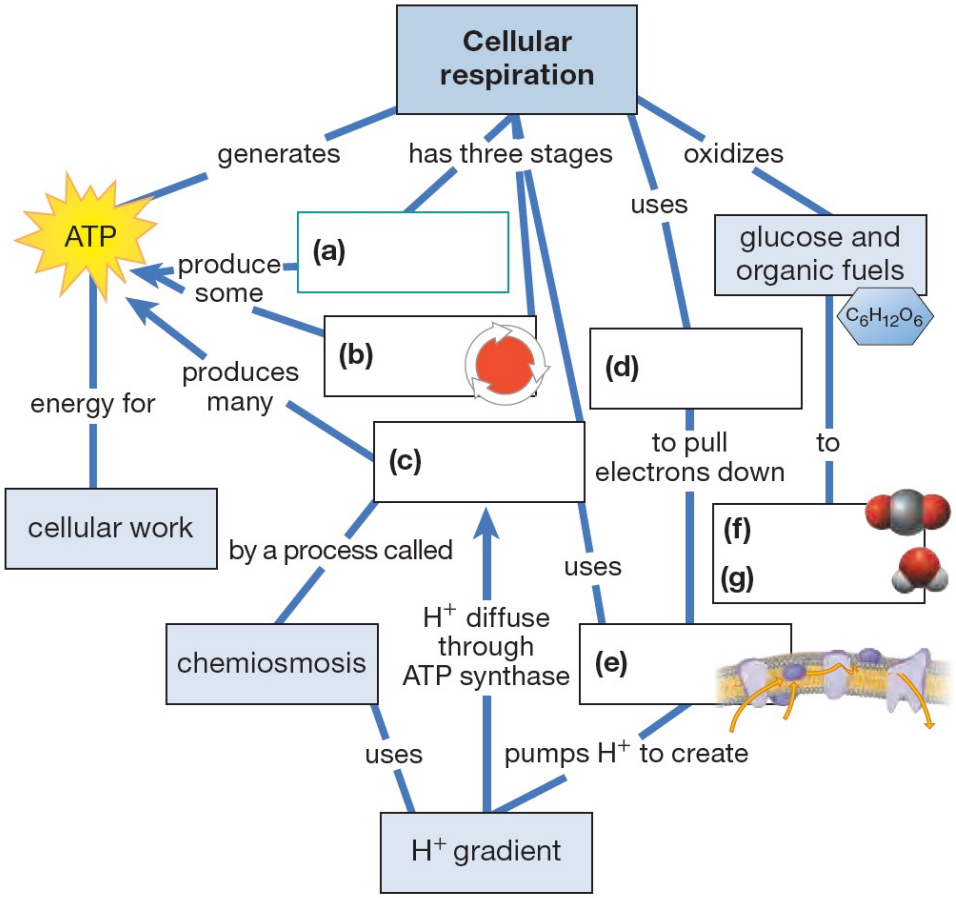
Assignment

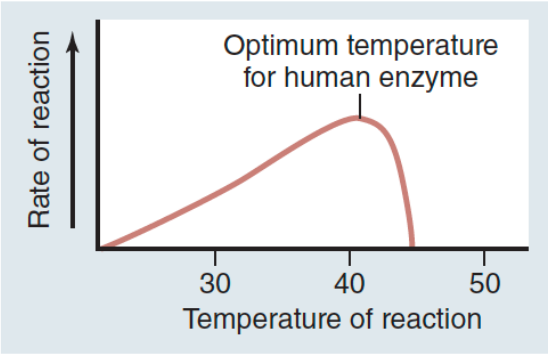
1. Fill in the blanks in this summary map to help you review the key concepts of cellular respiration.



Assignment

2. Examine the graph showing the rate of reaction versus temperature for an enzyme–catalyzed reaction in a human.

   a. Describe what is happening to the enzyme at around 40°C.
   b. Explain why the line touches the *x*-axis at approximately 20°C and 45°C.
   c. Average body temperature for humans is 37°C. Suggest a reason why the temperature optimum of this enzyme is greater than 37°C.



3. Explain how your body can convert excess carbohydrates in the diet to fats. Can excess carbohydrates be converted to protein? What else must be supplied?
